

Transportation Asset Management Webinar Series

Webinar 82

Risk and Resilience in Asset Management

Sponsored by FHWA and AASHTO

September 16, 2026

2026 AASHTO Committee on Performance-Based Management

October 6–8, 2026 The Westgate Hotel | San Diego, CA

- CPBM Annual Meeting: San Diego, October 2–6, 2026
- Today's topic includes the Transportation Asset Risk and Resilience (TARR) Manual, NCHRP 23-32
- Voting member workshop: October 2, San Diego — travel support available
- New monthly CPBM newsletter — signup link in the chat
- amclaughlin@aaashto.org

Welcome!

- Today is the **82nd** webinar in our bimonthly series, held on Wednesdays at 2:00 PM ET
- Webinars cover a variety of topics with a performance management focus
 - You will be able to find the materials from this webinar on the TAM Portal: <https://www.tam-portal.com/event-directory/tam-webinars/>
- We are always welcoming ideas for webinar topics and presentations!
- Use the webinar chat to submit questions for today's presenters and ideas for future webinars

The screenshot shows the 'TAM WEBINARS' page on the Transportation Management Hub website. The page has a blue header with navigation links: 'Transportation Management Hub', 'TPM Portal', and 'ERM Portal'. Below the header is a navigation bar with 'Resources', 'Tools', 'Events', 'Community', and 'About'. The main title 'TAM WEBINARS' is centered. A description box states: 'Description: Since 2012, FHWA and AASHTO have sponsored a webinar series addressing topics in transportation asset management including financial planning, risk management, tradeoff analysis, data management, integration of MAP-21 plans, and more. Webinars feature transportation practitioners sharing lessons learned and providing demonstrations of the TAM tools and methods that are helping to expand the impact of asset management at DOTs nationwide. Register here for upcoming webinars.' Below the description is a 'Search Filters' section with tabs for 'Infrastructure Assets', 'Management Processes', and 'Capabilities'. A search bar with 'Search' and 'Reset' buttons is present. To the right, a 'Sort By' dropdown is set to 'Publication Date' with a 'Newer first' option. The page displays '88 results'. A grid of six webinar thumbnails is shown, each with a play button icon. The thumbnails are: 'TAM Webinar 79: Making Data Work for Asset Management' (Mar 2026), 'TAM Webinar 78: 2026 TAMP Developments' (Dec 2025), 'TAM Webinar 77: Advanced Technologies for TAM and TPM' (Oct 2025), 'TAM Webinar 76: Recent Research Roundtable', 'TAM Webinar 75 - Risk Management Plans in TAMPs', and 'TAM Webinar 74: Life Cycle Planning'.

Webinar Objectives

- **Explore** how agencies are addressing natural threat–asset pairs in their TAMPs and how these approaches align with the forthcoming TARR Manual
- **Identify** key challenges agencies face in assessing and managing asset risks, including data, risk assessment methods, prioritization, funding, and integration into asset management decisions
- **Consider** how the forthcoming TARR Manual can help agencies strengthen current practices and more effectively incorporate risk and resilience into TAM
- **And as always, share** practical lessons, experiences, and ideas that agencies can apply to advance risk-informed and resilient asset management

Webinar Agenda

- 2:00 Welcome and Agenda Overview**
Anna McLaughlin, AASHTO
Hyun-A Park, Spy Pond Partners

- 2:15 Transportation Asset Risk and Resilience (TARR) Manual**
William Johnson, Spy Pond Partners

- 2:30 Panel of Subject Matter Experts**
Claire Martini, Colorado Department of Transportation
Habte Kassa, Georgia Department of Transportation
Christopher Berrens, Minnesota Department of Transportation

- 3:00 Q&A Discussion and Wrap Up**
Hyun-A Park, Spy Pond Partners

Transportation Asset Risk and Resilience Manual

NCHRP 23-09 Scoping Study to Develop the Basis for a Highway Standard to Conduct an All-Hazards Risk and Resilience Analysis.

Completed 04/20/2022

NCHRP 23-32 Transportation Asset Risk and Resilience.

Expected Completion date 11/27/2026

TARRMANUAL.COM

Need for a Transportation Asset Risk and Resilience Manual

“In 2023, there were a record-breaking 28 individual confirmed U.S. billion-dollar weather and climate disasters (Climate Central 2024). These events resulted in an estimated **492 lives lost** and over \$93 billion in damages. In 2024, there were 27 individual weather and climate disasters with at least \$1 billion in damages, resulting in **586 direct or indirect fatalities** and an estimated total cost of \$182.7 billion (NOAA 2025a).”

Need for a Transportation Asset Risk and Resilience Manual

FY 2026 FHWA ER Allocations

- Federal-Aid Highways – \$1.77 Billion
- Federally-Owned Roads – \$97 Million
- **Total = \$1.86 Billion**

Manual Framework & Chapter Architecture

TRANSPORTATION ASSET RISK & RESILIENCE (TARR) • COMPREHENSIVE TAXONOMY

4 Sections • 26 Chapters

Phase I of Many

Section I
Foundational Chapters

Ch 1–8

ORIENTATION

- Ch 1: Background & Purpose
- Ch 2: Manual Application

FRAMEWORK CORE

- Ch 3: Organization
- Ch 4: Scoping
- Ch 5: Assessment

DATA & MODELING

- Ch 6: Resilience
- Ch 7: Data Sources
- Ch 8: Data in Modeling

Section II
Technical Chapters: Risk
Assessment in Transportation

Ch 9–17

STRUCTURES

- Ch 9: Scour · Bridge
- Ch 10: Flood · Bridge
- Ch 11: Storm Surge · Bridge
- Ch 12: Riverine Flood · NBI Culverts

ROADWAY & DRAINAGE

- Ch 13: Inland Flood · Pavement
- Ch 14: Sea Level Rise · Pavement
- Ch 15: Flood Erosion · Embankment

GEOTECH & WIND

- Ch 16: Rockfall · Pavement
- Ch 17: Wind · Mast Arm

Section III
Multi-Modal Application
Quantitative Risk Assessment
in Transportation

Ch 18–20

 MARITIME

- Ch 18: Marine · Bridge Strike

 RAIL TRANSIT

- Ch 19: Extreme Heat · Rail Track

 AVIATION

- Ch 20: Extreme Heat · Airport Departures

Section IV
Management of Risk &
Resilience & Case Studies

Ch 21–26

Investment Decision Making

- Ch 21: Measuring Asset Resilience
- Ch 22: Management of Risk & Resilience

State DOT Case Studies

- Ch 23: Arizona DOT (Scour-Bridge)
- Ch 24: NC DOT (Post-Event Assessment)
- Ch 25: Virginia DOT (Sea Level Rise)
- Ch 26: Georgia DOT (Enterprise)

Risk and Resilience Defined

Risk - The potential for an unwanted outcome resulting from an incident, event, or occurrence, as determined by its likelihood and associated consequences (AASHTO 2017)

Resilience - “the ability to prepare and plan for, absorb, recover from, or more successfully adapt to adverse events” (AASHTO 2017)

$$C \times V \times T$$

Where:

C = Consequence (\$)

V = Vulnerability (%)

T = Threat (%)

ROBUSTNESS

The ability to withstand disaster forces without significant degradation or loss of performance.

REDUNDANCY

The extent to which the systems can satisfy functional requirements if significant degradation or loss of functionality occurs.

RESOURCEFULNESS

The ability to diagnose and prioritize problems and to initiate solutions by identifying and mobilizing resources.

RAPIDITY

The capacity to restore functionality, contain losses, and avoiding disruptions.

Risk and Resilience Framework

Assessment Procedure and Data

Example: Scour – Bridge

Model Steps	Data Sources/Resources Needed	Output
Step 1: Asset Data Collection	<u>All Levels:</u> - NBI database - Agency's asset management databases <u>Levels 2 and 3:</u> - As-built plans - Inspection records	Asset Data
Step 2: Threat Data Collection	<u>Level 1:</u> - National H&H toolsets <u>Levels 2 and 3:</u> - Agency H&H toolsets - Detailed H&H assessments - Expert knowledge - SME: H&H	Threat Probability by Magnitude (T , %)
Step 3: Owner Consequence Assessment	<u>Levels 2 and 3:</u> - FHWA bridge repair and full replacement costs - NBI database - Agency's maintenance records - Economic impact studies - Expert knowledge - SME: Economic impact analysis	Consequences (C , \$)
Step 4: Vulnerability Assessment	<u>Levels 2 and 3:</u> - Analytical fragility) - Scour depth - SME: Bridge engineer - SME: H&H	Vulnerability (V , %)
Step 5: Risk Assessment	<u>Levels 2 and 3:</u> Risk = $C \times V \times T$	Risk in monetary losses (\$)

TAM Data and Risk and Resilience

Example: Flood – Bridge

Flood Induced Loading for Bridges

Department of Transportation

Risk and Resilience in Asset Management

Claire Martini, Risk and Resilience Program Manager

Organizational Structure

Asset Management Program

Coordinates with FHWA, the Department's asset-program managers, CDOT Regions, and other agencies to manage the 12 asset classes. The program meets federal requirements for asset management (e.g., TAMP development), and coordinates budget setting and treatment-list development for the four-year program for the asset classes.

Performance Management Program

Collects performance data for various CDOT programs and meets National Performance Measure reporting requirements (including PMI, PM2, and PM3 measures/ targets). The program also develops CDOT's state-required *Performance Plan*, which contains the Department's annual strategic goals and reports on annual performance against PD 14.0 targets.

Risk and Resilience Program

Develops tools and processes to analyze and enhance resilience considerations in support of federal and state requirements, and leads the implementation of PD 1905.0 for CDOT.

Economic Analysis Program

Develops asset valuations and economic forecasts in support of asset management. The program also performs cost/benefit analysis for federal grant opportunities, and maintains and develops tools for economic analysis and project selection and prioritization.

Risk and Resilience in Asset Management

1. Managing risk across various levels: Enterprise (strategic), Program, and Project/Activity levels.
2. Defining the risk process: Developing the risk register to establish risk-management priorities.
3. Considering risk and resilience as part of life-cycle planning and life-cycle cost analysis.
 - Consideration of extreme weather and resilience in life-cycle and risk analysis, per 23 USC 119(e)(4)(D).
 - Identification and treatment of twice-damaged assets (as required under 23 CFR 667).

Prioritized Natural Hazards on CDOT's Enterprise-Level Risk Register

Enterprise Threats	Risk Statement	Risk Score	Risk Management Strategy
Flood	There is a risk that flooding occurs leading to asset/route damage that causes mobility and safety impacts as well as increased asset management cost.	68 (T)5*(C)4.5*(V)3	Treat by implementing design standards; following agency continuity of operations plan; maintaining incident command center management structure; maintaining an Office of Emergency Management (OEM). Use tools and processes developed under the resilience program to identify high risk assets and corridors for focused analysis.
Post-Fire Debris Flow	There is a risk that post-fire debris flow occurs leading to asset/route damage that causes mobility and safety impacts as well as increased asset management cost.	48 (T)4*(C)3*(V)4	Treat by maintaining and office of OEM. Maintenance landscaping, erosion control, jersey barriers, and other practices.
Geohazards	There is a risk of geotechnical failure that causes mobility and safety impacts as well as increased asset management cost.	33 (T)5*(C)3.3*(V)2	Treat by implementing the geohazards management program and robust geohazards management plan.
Fire	There is a risk that fire occurs, leading to asset/route damage that causes mobility and safety impacts as well as increased asset management cost.	14 (T)4*(C)1.2*(V)3	Tolerate in the case of wildfires; and treat by tunnel fire-suppression systems and bridge-design standards, etc. Use tools and processes developed under the resilience program to identify high risk assets and corridors for focused analysis.
Snow (Avalanche)	There is a risk of avalanche occurring that causes mobility and safety impacts as well as increased asset management cost.	11 (T)4*(C)2.7*(V)1	Treat by maintaining a Winter Operations Program. Use tools and processes developed under the resilience program to identify high-risk assets and corridors for focused analysis.

Relevant Threat-Asset Pairs

TARR Manual	Both	CDOT's R&R Manual
Riverine Flood Erosion - Roadway Embankment	Scour - Bridge	Flood - Culvert (any size)
Inland Flooding - Pavement	Flood - Bridge	Flood - Bridge Approach
Wind - Mast Arm	Riverine Flooding - NBI Culverts	Rockfall - Bridge
Extreme Heat - Rail Track	Rockfall - Pavement	Debris Flow - Culvert (Post-Fire component)
Extreme Heat - Airport Departures		Debris Flow - Roadway (Post-Fire component)
		<i>Wildfire - Roadway</i>
		<i>Avalanche - Roadway</i>

Challenges and Opportunities in Managing Asset Risks

- Advancing project development at the nexus of asset condition and resilience.
- Pursuing data that can be used to improve long-term asset durability. In particular, future natural hazard vulnerability data, including extreme weather data.
- Building resilience into the asset management model. Developing resilient treatment recommendations.

Potential Approaches to Incorporate Dynamic Data into Threat-Asset Modeling

Threat	Asset(s)	Method	Non-Stationary Data
Rockfall	Roadway Prism Bridge	Change Factors	Precipitation
		Threat Likelihood Change	Temperature
		Decay Factors	Freeze-Thaw/ Permafrost Thaw
Flood	Roadway Prism Bridge Bridge Approaches	Change Factors	Precipitation
		Threat Likelihood Change	Temperature
		Continuous Simulation	Snowpack/Snow Water Equivalent (SWE)
Wildfire	Roadway Prism Culvert Bridge	Change Factors	Precipitation
		Threat Likelihood Change	Temperature
			Fuel Moisture
			Relative Humidity
			Solar Radiation

Adding “Step 0” to Quantitative Risk & Resilience Assessment Methodology

Step 0: Future Data

- Non-Stationarity, Change Factors
- Decay Rates
- Probabilistic Modeling

Step 1: Threat Data Collection

- Threat Data Source
- Threat Likelihood (Baseline + Future-Adjusted)

Step 2: Asset Data Collection

- Asset Data Needs

- Existing (Baseline) Condition
- Proposed Conditions (for Resilience)

Step 3: Owner Consequence Calculation

- Owner Worst Reasonable Case (WRC) for Threat-Asset Pair
- Asset Unit Cost Estimation
- *Total Owner Consequence*

Step 4: User Consequence Calculation

- User WRC for Threat-Asset Pair
- Vehicle Operating Cost (VOC) and Loss of Wages (LW)
- Detour Estimation (Extra Travel Length, Time)
- *Total User Consequence*

Step 5: Vulnerability Assessment

- Threat-Asset Pair Vulnerability

Step 6: Risk Assessment

- Annual Owner Risk Calculation
- Annual User Risk Calculation
- *Total Annual Risk*

Step 7: Resilience Management

- Risk tolerance
- Decision-making and investment strategy

TARR Manual Opportunities for DOT Use

- Application of non-stationarity to risk and resilience assessment
- Out-of-the-box methodology for new threat-asset pairs
- Advancing understanding and quantification of asset performance (fragility curves)
- Levels of analysis
- Resilience Management” guidance

Exhibit 22-1. Opportunities to Incorporate Risk and Resilience into Decision-Making within Transportation Agencies

Decision Points	Typical Questions	Application of the TARR Manual	Extension of Results
Screening and Asset Management	Where are the most important concentrations of risk?	The manual supports the identification of assets, corridors, or threats requiring further review	Supplement conditions-based decision-making with threat, vulnerability, criticality, and consequence information. Risk should be considered alongside condition, preservation needs, safety, mobility, and life-cycle costs

Department of Natural Resources

Background

This dashboard displays future projected precipitation change factors and temperature differences (historical to future) in Colorado. The scenario-specific scaling factors can be applied to design depths when developing climate-affected intensity-duration-frequency (IDF) curves for future scenarios. The two climate scenarios modeled in this dashboard are SSP2-4.5 and SSP5-8.5. These are greenhouse gas emission climate scenarios, known as Shared Socioeconomic Pathways (SSPs), which represent possible future climate scenarios that could develop over the next century.

Flood-Roadway Example

Approach: Fix (i.e., make constant) both the consequence and vulnerability by adjusting the likelihood to properly reflect future risk conditions.

$$\text{Risk Score} = C \times V \times T$$

C = Consequences and considerations

V = Vulnerability of CDOT to risk event; the probability that estimated consequences will be realized

T = Threat likelihood (probability) event will occur

Flood-Roadway Example

GDOT TAM Risk and Resilience

Habte Kassa

September 16, 2026

1. Key Natural Hazard Risks Affecting Georgia Transportation Assets

Extreme rainfall is one of Georgia's most significant climate threats, directly affecting both pavement performance and bridge operations.

Threat	Asset	Resiliency Strategy
Intense rainfall	Pavements	- Utilizes Open Graded Friction Course (OGFC) on interstate pavements to improve drainage and safety - Utilizes Pavement Management System (PMS) – See next page
Flooding/storm events	Bridges	Utilizes BridgeWatch monitoring system and inspection data

Illustration of Rainfall Flow Path on Open Graded Friction Course (OGFC) Surface

1.1 GDOT Pavement Management: Managing Asset Risk

How the pavement management program addresses data, risk assessment, prioritization, funding, and organizational challenges

1. Data & Condition

- Statewide automated pavement data collection supports consistent condition measures.
- OCI and pavement distress data are integrated into dTIMS and the Resurfacing Database.
- QA/QC, LRS reconciliation, and field review help address data gaps and anomalies.

2. Risk Assessment

- dTIMS evaluates deterioration, treatment timing, and life-cycle impacts.
- Pavement condition is combined with roadway importance, traffic, and network objectives.
- Forecasting identifies where current conditions create future system risk.

3. Prioritization

- Projects are prioritized through condition, treatment strategy, cost, and network needs.
- The Wishlist / Project Picking process connects pavement needs to programmed work.
- Interstate, NHS, and other critical routes receive additional management attention.

4. Funding Constraints

- Funding levels are tested against long-term pavement needs and performance targets.
- Scenario analysis demonstrates the consequences of different investment levels.
- Preservation is used strategically to extend pavement life when reconstruction cannot be funded.

5. Organizational Coordination

- Maintenance, Planning, OMAT, OTD, and Districts share responsibility for asset decisions.
- Pavement evaluations inform project development and STIP programming.
- TAMP performance measures provide a common statewide framework.

6. Resilience & Uncertainty

- Forecasting accounts for changing pavement condition, traffic, costs, and network growth.
- Concrete pavement and high-risk locations require longer-term strategies.
- Remaining challenge: better quantify uncertainty, climate/resilience impacts, and consequence of failure.

Core approach: measure → assess risk → optimize treatments → program projects → monitor performance

2. Challenges in Integrating Risk and Resilience into Asset Management

The greatest challenge is moving from reactive event response to proactive, data-driven resilience planning.

3. How the TARR Manual Could Advance GDOT's Resilience Practices

The TARR Manual presents an opportunity to establish a consistent, scalable framework for integrating resilience into transportation asset management.

Threat identification

Risk assessment

Asset management decisions

Resilience investments

Performance monitoring

GDOT has already integrated resilience into bridge monitoring and pavement management practices. The TARR Manual could help expand these efforts by providing a more consistent **framework for risk assessment, prioritization, and resilience-based investment decisions** across asset classes.

Chapter 12 Riverine Flooding-NBI Culverts

Introduction Summary

For the purposes of this chapter, culvert failure is defined as the loss of the structure's ability to perform its intended function as a result of structural collapse, significant erosion, or inadequate hydraulic capacity, such that full replacement of the asset is required.

Modeling Levels

LEVEL 1

Coarsest scale of risk assessment applied when data are limited, using existing threat maps (e.g. FEMA FIS), inspection reports and SNBI data to identify potential culvert and roadway overtopping and damage, narrowing inventory to assets needing further analysis.

LEVEL 2

Intermediate scale of risk assessment that uses limited hydraulic modeling (e.g., HDS-5 HY-8), geomorphologic data, and inspection reports to overtopping and damage potential refining the inventory to identify culverts requiring potential improvements.

LEVEL 3

Advance scaled of risk assessment with more sophisticated hydraulic modeling (e.g., HEC-RAS) and detailed geomorphologic analysis as well as agency and industry design standards and methods for culvert design.

Vulnerability Assessment Flow Chart

Culvert failure due to flooding can occur through the following multiple mechanisms and failure modes:

- Headwater elevation relative to the culvert and embankment fill is a primary influence;
- Erosion of roadway embankment material leading to pavement damage or washout;
- Scour/erosion at the inlet, outlet, or along the culvert barrel;
- Reduced conveyance capacity may result from debris accumulation or sediment deposition;
- Hydraulic surcharge loading and seepage through the embankment can compromise embankment integrity;
- Loss of structural support due to undermining, piping, or internal erosion; or
- Hydrostatic or uplifting pressure fluctuations induce strain, cracking, joint failures, or deformation.
